

Purge & Archive with Integrity

"We had been running JD Edwards for 10 years and were unable to purge data without losing referential integrity. With some relatively simple Query type data selection, we were able to reduce some of our larger databases by approximately two thirds. Our users have seen reduced run times on many reports and on-line inquiries. It has been a great tool for us to quickly reduce our database sizes with minimal effort."

Bill Tritch, JD Edwards Product Manager, Cargill Inc.

Many companies on the iSeries and AS/400 platforms have been looking for a way to purge and archive their data. The standard purge programs tend to lock files and not support data integrity across functional areas. The ARCTOOLS/400™ Module for JD Edwards World and EnterpriseOne provides purge and archive functionality that won't lock your files and will support integrity across functional areas. Now you can purge and archive your data without locking out the users, on your schedule, and without adversely affecting system performance.

Features of ARCTOOLS/400™ Module

This revolutionary product provides the following features:

- Purges and archives without programming and without locking files.
- Creates and modifies tasks as easily as writing a Query.
- Supports JD Edwards data integrity. Running standard JD Edwards World and EnterpriseOne purges often results in data integrity problems across modules. ARCTOOLS/400™ purges and archives related data so that integrity reports and other functions are intact.
- Installs quickly and is easily customised. Fine-tune purge criteria, add custom files without programming.
- Runs purges in manageable increments. No more long weekends wasted. Start and stop purge and archive tasks as needed.
- Exclusive throttle function prevents adverse impact on other system activity.
- Developed in collaboration with JD Edwards.
- Used by both JD Edwards World and EnterpriseOne sites.
- Experienced JD Edwards support available.

"ARCTOOLS allows us to create a common methodology to archive all major transactional files in the JDE database. Every option is automatically documented and logged, so it is clear as to what steps are taken."

Tom Crawford, Senior Analyst, Permatex Inc.

Reorganise files without locking out the users

When systems start to slow up there is a temptation to purchase bigger, faster and more expensive hardware to improve performance. In fact you could save your budget and use data management techniques such as purging, archiving and reorganising files to accomplish the same goal.

Many AS/400 and iSeries users have not been able to realise the benefits of reorganising files because of the way the standard IBM reorg command locks the files. This has the unacceptable consequence of locking the users out of the system - often for hours, sometimes for days. ReorgWizard overcomes this problem so that you can now reorganise files without locking out the users.

Features of ReorgWizard

This revolutionary product provides the following features:

- Reorganise a file in increments.
ReorgWizard allows you to reorganise a file in manageable increments - do part of the file today, some tomorrow, more next week.
- Control the resources allocated to the reorg.
ReorgWizard includes an exclusive 'throttle' feature that allows you to control the rate at which records are reorganised. Left unchecked, reorgs can command a high level of CPU, often slowing down other jobs. The throttle feature allows reorgs to be slowed down so that other jobs aren't affected.
- Schedule regular reorgs.
Allows regular reorgs for critical files.
- Library analysis tools.
Library space analysis tools show you which files are most in need of reorganisation.
- Integrated with ARCTOOLS/400™.
The purging and archiving solution ARCTOOLS/400™, also available from Whitehouse Consultants, includes built-in support for ReorgWizard.
- Save on hardware upgrade costs.
Now you can employ good data management techniques to speed up your system.
- Reorganise your files almost any time.
ReorgWizard doesn't lock the files, so you can run reorgs without the danger of locking users out of the system.
